

How to make an ultraviolet lightbox

You can construct your own box from plywood which has been painted black inside and outside.

You will need to make a rectangular box with two small windows in the front and one larger window in the top.

Then install the UV stick light into the top underside of the box.

How to make an ultraviolet viewing lamp

The simplest way is to use an ordinary desk lamp. All you need to do is replace the fluorescent tube with an ultraviolet stick light.

Then place a piece of black fabric over the top to shield the hands from as much natural light as possible.

The advantage of having your own viewing lamp or box is that you will be able to conduct the activities whenever you wish. UV stick lights are available from most electrical or hardware stores. For further information visit www.health.qld.gov.au/germbusters
