URN:
Family name:
Given name(s):
Address:
Date of birth: Sex: [] M [] F [] I

- 1. In the presence of risk factors (sepsis, haemolysis, acidosis or asphyxia) use the lower line.
2. If baby is greater than 12 hours old with total serum bilirubin (TSB) 1-50 micromol/L below the line, repeat the TSB within 6-24 hours.
3. Babies under phototherapy:
a. Consider measuring the TSB 4-6 hourly until the rise of serum bilirubin is known to be controlled, then measure TSB 12-24 hourly.
b. If the TSB is greater than 50 micromol/L below line, stop phototherapy and recheck in 12-24 hours.
4. If baby presents with TSB above threshold and the TSB is not expected to be below the threshold after 6 hours of intensive phototherapy, an exchange transfusion is indicated.
5. If there are signs of bilirubin encephalopathy an immediate exchange transfusion is recommended.

Baby 35+0 to 37+6 weeks gestation

Table with 5 columns: Date, Time (24hr), TSB Result, Start time (24hr), End time (24hr). Includes multiple rows for data entry and 'Comments:' sections.
