

TEETHING

Baby teeth allow children to eat, speak and smile

- Baby teeth first appear at about six months, but this varies between children.
- Children usually have all their baby teeth by 3 years of age.

This is the usual timing of when baby teeth appear:

Tips to manage teething

Teething may cause discomfort but does not usually cause high fevers. If your child has a fever and/or is ill, seek medical attention.

Mild teething discomfort may be eased by:

- Chewing on chilled teething rings.
- Chewing on crusts of bread, chilled fruits or vegetables (e.g. cucumber, carrot, apple) or sugar and salt free rusks.
- A parent/carer gently rubbing the gums with a clean finger.

Clean teeth as soon as they appear with a small, soft toothbrush. At 18 months, add low fluoride toothpaste to the routine.

Did you know some baby teeth are in the mouth until children are 12?
