

Module overview

Please note: This module must be read in conjunction with the Fundamentals of the Framework (including glossary and acronym list).

Cardiac services are a specialised area of medicine involved in the diagnosis, management and treatment of complications of patients with a wide range of cardiac and/or coronary artery disease—hereafter referred to collectively as cardiac disease.

The management of patients with cardiac disease encompasses the full continuum of care from treatment of early symptoms and risk factors through to the diagnosis and management of chronic disease. It requires high-level and prompt management of acute and critical symptoms to minimise mortality and maximise individual long-term health. Highly specialised management of complex issues necessitates subspecialty expertise to ensure patients receive the highest quality healthcare service.

The cardiovascular continuum of care and management is complex and requires a high degree of specialisation. This continuum includes prevention, screening, diagnosis, acute or ongoing medical care, surgery, rehabilitation and palliative care. As a result, evidence-based care is delivered in a range of settings by a diverse range of health professionals and requires documented processes among providers—including those in the community—across secondary care and among multidisciplinary groups.

The range of settings for the delivery of cardiac services includes public or private hospitals, stand-alone facilities, community healthcare settings and the patient's home. Increasing degrees of patient complexity, acuity and critical illness impact on staffing and service requirements, resulting in complex service delivery implications for facilities.

Children have specific needs in health services—please refer to the relevant children's services modules.

This module outlines four levels of complexity for cardiac service provision: Levels 3 to 6. It is accepted emergency presentations may occur at any facility, requiring temporary management of the patient. In a lower level facility, such care and stabilisation should occur in consultation with a higher level service prior to timely transfer. The focus of this module is on specialised cardiac services, including care provided by public and private health facilities.

The Cardiac Services module contains six sections which should be read collectively, and include:

Section 1: Cardiac (Coronary) Care Unit Services (Levels 4 to 6)

Section 2: Cardiac Diagnostic and Interventional Services (Levels 3 to 6)

Section 3: Cardiac Medicine Services (Levels 3 to 6)

Section 4: Cardiac Rehabilitation Services (Levels 4 to 6, including Ongoing Prevention and Maintenance Services)

Section 5: Cardiac Surgery Services (Level 6)

Section 6: Cardiac Outreach Services

Across the sections, it is a general expectation Level 3 services have access to a registered medical specialist with credentials in internal medicine, have provision for electrocardiography and may provide exercise stress testing. As the levels develop increasing sophistication, it is expected Level 4 services provide echocardiography, exercise stress testing and a cardiac care unit, along with a registered medical specialist with credentials in internal medicine and/or a registered medical specialist with credentials in cardiology. Level 4 services may provide transoesophageal echocardiography (TOE) and cardiac catheterisation, while these services, as well as percutaneous coronary intervention, are expected to be provided at Level 5 and 6 services, along with the development of electrophysiology services. A registered medical specialist with credentials in cardiology is also required at a Level 5 service, along with an on-call echocardiography and catheter lab service. As Level 6 typically provides superspecialty services, cardiac surgery services are provided at this level.

Section 1: Cardiac (coronary) care unit services

Cardiac (coronary) care units (hereafter referred to as cardiac care units) are specialised areas providing intensive care for emergency and acute cardiac illness at a high level of expertise. Cardiac care units receive patients from a variety of sources, including directly from the community, via ambulance services and emergency departments, and as internal and external referrals and transfers. Cardiac care units have advanced monitoring and diagnostic equipment, and access to a variety of multidisciplinary healthcare professionals to ensure provision of the full range of appropriate clinical and associated care.

Section 2: Cardiac diagnostic and interventional services

Cardiac diagnostic and interventional services include the full range of cardiac diagnostic and interventional services. Cardiac diagnostic services vary from exercise stress testing, Holter monitoring and transthoracic echocardiography to radioisotope stress testing, magnetic resonance imaging and positron emission tomography. These non-invasive means of diagnosing a patient's possible cardiac condition are further supported by invasive methods of investigation, including cardiac catheterisation (also known as cardiac angiography) and electrophysiology studies. Highly invasive methods of investigation require teams of specialised medical, nursing and allied health staff, often with specific training and dedicated equipment.

Cardiac catheterisation, electrophysiology or multipurpose laboratories are specialised clinical areas providing advanced monitoring, mapping, radiological, and diagnostic and interventional equipment to support the range of procedures for routine and emergency

cardiac care. All cardiac catheterisation, electrophysiology or multipurpose laboratories must have the capacity to provide resuscitation, the stabilisation of emergencies, and access to a variety of multidisciplinary healthcare professionals to ensure the provision of the full range of appropriate clinical and associated care. Patients requiring these services come from a variety of sources, including directly from the community via ambulance services and emergency departments, and as internal and external referrals and transfers.

Section 3: Cardiac medicine services

Cardiac medicine provides an array of preventative, screening, diagnostic, treatment and rehabilitative services across general and specialised cardiac medical problems. Services may also provide a close observation area for patients with more complex conditions.

Section 4: Cardiac rehabilitation services, and ongoing prevention and maintenance services

Cardiac rehabilitation services, both inpatient and outpatient, encompass all measures used to help people with cardiovascular disease return to an active and satisfying life, and to prevent future cardiac events. Cardiac rehabilitation should be tailored to meet the information, education, support and cultural needs of patients and their families, and align with best practice, such as the National Heart Foundation's 2004 framework.¹

The provision of cardiac rehabilitation services includes a number of elements: physical activity, health education, counselling, behaviour modification strategies and support for self-management. These should be routinely integrated into the management of all patients. All eligible patients should be offered inpatient cardiac rehabilitation, unless there are clinical contraindications. Not all elements of a rehabilitation program may be utilised for every cardiac patient during the inpatient period. However, individuals may access cardiac rehabilitation services at varying stages. Routine referrals to outpatient cardiac rehabilitation programs are increasingly important as part of the cardiovascular health continuum.

Ongoing prevention and maintenance services involve longer term services and/or programs aimed at helping people with cardiovascular disease maintain an active and satisfying life, and decreasing the risk of future cardiovascular events.

Section 5: Cardiac surgery services

Cardiac surgical services act as referral services for cardiac surgical patients and are capable of providing a range of cardiac surgical services with the associated comprehensive cardiac care services, including perioperative and post-operative care, and multisystem life support.

Section 6: Cardiac outreach services

Cardiac outreach services have been established to help improve health outcomes for rural Australians by increasing access to medical specialist services in metropolitan, regional, rural and remote communities. Visiting specialist services in geographical areas of identified need assist in addressing the burden cardiac disease places on people in rural and remote communities.

Services not within the scope of the Cardiac Services module include:

- primary prevention of cardiac disease
- screening, detection and management of early coronary artery and cardiac disease by primary healthcare providers
- cardiac services for children, which are addressed separately in the Children's Services modules.

Service networks

In addition to what is outlined in the Fundamentals of the Framework, specific service network requirements may include access to:

- chronic disease programs
- Heart Support Australia
- Heartline, the COACH Program and 13HEALTH
- the National Heart Foundation
- the Queensland Cardiovascular Health and Rehabilitation Association.

Where cardiac services (e.g. outpatient cardiac rehabilitation services) are outsourced to private organisations, service agreements will be required to ensure alignment with the CSCF.

Service requirements

In addition to what is outlined in the Fundamentals of the Framework, specific service requirements include:

- provide relevant clinical indicator data to satisfy accreditation and other statutory reporting obligations.

Section 1: Cardiac (coronary) care unit services

Cardiac (coronary) care unit services

	Level 4	Level 5	Level 6
Service description	<ul style="list-style-type: none"> • may be collocated within an intensive care service or may be stand-alone unit. • capable of providing high standard of general cardiac care, but does not have level of service to care for critically ill cardiac patients e.g. patients requiring advanced haemodynamic support. • unit managed by registered medical specialist with credentials in cardiology or internal medicine and experience in cardiology. • has on-site non-invasive diagnostic procedures, including exercise stress testing and echocardiography, and access to diagnostic cardiac catheterisation, for low-complexity patients. 	<ul style="list-style-type: none"> • provides comprehensive cardiac care to critically ill and complex cardiac patients. • access—24 hours—to on-site diagnostic and interventional services (cardiac catheterisation and/or multipurpose suite), and undertakes percutaneous coronary intervention on all but highest complexity patients. • may be referral centre for lower level services. 	<ul style="list-style-type: none"> • provides highest level of complex care for patients with serious cardiac conditions requiring continuous cardiac and haemodynamic monitoring. • on-site access to cardiac surgery. • service is staffed by specially trained medical and nursing staff, enabling close monitoring and early intervention. • may be referral service for all lower level coronary care services.
Service requirements	<p>As per module overview, plus:</p> <ul style="list-style-type: none"> • access to diagnostic cardiac angiography for low-complexity adult patients. • on-site non-invasive diagnostic procedures, including transthoracic 	<p>As per Level 4, plus:</p> <ul style="list-style-type: none"> • on-site access to diagnostic and interventional services (cardiac catheterisation). 	<p>As per Level 5, plus:</p> <ul style="list-style-type: none"> • access to electrophysiology services in addition to full range of diagnostic and interventional services (cardiac catheterisation and coronary intervention).

	Level 4	Level 5	Level 6
	<p>echocardiography and exercise stress testing.</p> <ul style="list-style-type: none"> • capacity to insert temporary pacing wire. • access—24 hours—to troponin testing. • cardiac medications, including thrombolytics, on-site 24 hours. • all patients admitted under care of registered medical specialist with credentials in cardiology or internal medicine and experience in cardiology. • where patient throughput is less than recommended by relevant standards, thereby threatening ongoing competence, episodes of practice at higher level service may be required. • desirable for all registered nurses in CCU to be trained in advanced life support. 	<ul style="list-style-type: none"> • on-site access—24 hours—to surgical and medical services. • capacity to provide invasive monitoring and intra-aortic balloon pump management. • access to cardiac surgery via documented processes in place with nearest public or suitably licensed private health facility performing cardiac surgery; this affiliation must include agreed plan for emergency patient transfer to higher level service for emergency cardiac surgery and must be reviewed by both parties at least annually. • patients advised in advance of potential risk of delayed surgical intervention for complication arising from catheterisation procedure due to requirement for emergency transfer of patient to affiliated health facility for cardiac surgery. • evidence of comprehensive, ongoing medical, nursing, allied health and support service education programs, as appropriate, relevant to specialised facilities of the unit. • demonstrable and documented formal audit and review of cardiac care units 	<ul style="list-style-type: none"> • on-site cardiac surgery allowing service provision to higher risk patients (Section 5, Level 6 Cardiac Surgery Service).

	Level 4	Level 5	Level 6
		<p>and quality activities, including at least two targeted clinical audits, annually.</p> <ul style="list-style-type: none"> on-site access—24 hours—to general imaging services, including portable x-ray and computerised tomography (CT) with automatic film processing and/or picture archiving and communications system (PACS) and mobile image intensifier in designated units. transthoracic echocardiography accessible on-site 24 hours. on-site access—during business hours—to transo-esophageal echocardiography. access to cardiac viability assessment via nuclear medicine in addition to exercise stress testing. access to electrophysiology services may be accessible. 	
Workforce requirements	<p>As per module overview, plus:</p> <p>Medical</p> <ul style="list-style-type: none"> access—24 hours—to registered medical specialist with credentials in either cardiology or internal medicine and relevant experience in cardiology. all medical staff trained in advanced life support. 	<p>As per Level 4, plus:</p> <p>Medical</p> <ul style="list-style-type: none"> access—24 hours—to registered medical specialist with credentials in cardiology to cover cardiac care unit. sufficient supporting registered medical specialists with credentials in cardiology to provide sustainable coverage of cardiac care unit. 	As per Level 5 service.

	Level 4	Level 5	Level 6
	<p>Nursing</p> <ul style="list-style-type: none"> suitably qualified and experienced nurse manager (however titled). access to minimum of two nurses at all times, one being a registered nurse. suitably qualified and experienced registered nurse in charge on each shift with ability to interpret 12-lead ECG and administer thrombolysis. <p>Allied health</p> <ul style="list-style-type: none"> access to allied health professionals, as required. <p>Other</p> <ul style="list-style-type: none"> access to technical support staff (e.g. technical, biomedical and radiation safety specialists), as required. 	<ul style="list-style-type: none"> sufficient supporting registered medical specialists with credentials in cardiology to provide sustainable 24-hour coverage. <p>Nursing</p> <ul style="list-style-type: none"> all nursing staff responsible for direct patient care are registered nurses, with enrolled nurses, student nurses and assistants in nursing in this environment under supervision of registered nurse in supportive role. all nursing staff with or working towards relevant competencies in cardiac care nursing. <p>Allied health</p> <ul style="list-style-type: none"> access—24 hours—to identified pharmacist and physiotherapist. access—24 hours—to identified radiographer and echocardiographer or cardiac scientist.

Cardiac Rehabilitation -Ongoing Prevention and Maintenance Services

	Level
Service description	<ul style="list-style-type: none"> ongoing maintenance of behaviour change beyond period of time of ambulatory and/or inpatient rehabilitation critical for long-term health benefits. services or programs offered within this period have emphasis on supporting behaviours and decreasing risks of future cardiovascular events. where programs provided, both patient needs and available resources will determine type of program or service provided.

	Level
Service requirements	<p>As per module overview and outpatient cardiac rehabilitation programs, plus:</p> <ul style="list-style-type: none"> • follow-up processes and/or referrals by telephone, mail or in person, as required. • may include ongoing assessment and management of individual's goals. • may include involvement of registered medical practitioner as an integral part of an ongoing management plan. • may include access to exercise equipment.
Workforce requirements	<p>As per module overview, plus:</p> <ul style="list-style-type: none"> • designated health professional with credentials in, and knowledge of, cardiac rehabilitation or health behaviour / physical activity. • Aboriginal and Torres Strait Islander health workers, and community support workers, with services delivered either from community-controlled Aboriginal and Torres Strait Islander health service or, if service predominantly for Aboriginal and Torres Strait Islander peoples, from within an Aboriginal and Torres Strait Islander community.
Specific risk considerations	Nil

Section 5: Cardiac Surgery Services

Cardiac Surgery Services

	Level 6
Service description	<ul style="list-style-type: none"> • provides comprehensive surgical cardiac care, including complex multisystem life support, to critically ill patients, and on-site access—24 hours—to intra-aortic balloon pump insertion and management. • access to on-site intensive care service to provide pre- and post-operative care for cardiac surgical patients, and access to on-site interventional cardiac services (Section 2, Cardiac Diagnostic and Interventional Services) also available.

Level 6

- therapeutic and diagnostic procedures performed at all levels of patient complexity, as cardiac surgery is available on-site and cardiopulmonary bypass can begin within 2 hours where necessary.
- access within the state to extracorporeal membrane oxygenation and/or ventricular assist devices.

Service requirements

As per module overview, plus:

- documented processes for referral to subspecialist services (e.g. ventricular assist devices, transplant and medical specialists).
- access—24 hours—to perfusionist where extracorporeal membrane oxygenation services provided.
- documented processes for referral to allied health professionals who may be hospital or community-based.
- Royal Australasian College of Surgeons (RACS) accreditation if providing cardiac registrars' surgical training (see www.surgeons.org).
- access to cardiac rehabilitation (Section 4, Cardiac Rehabilitation Services).
- access—24 hours—to relevant equipment to support intra-aortic balloon insertion, extracorporeal membrane oxygenation and ventricular assist devices.

Workplace requirements

As per module overview, plus:

Medical

- access to two registered medical specialists with credentials in cardiac surgery to provide 24-hour cover for cardiac surgical services.
- access—24 hours—to registered medical specialist with credentials in cardiac surgery for consultation and emergency procedures.
- access—24 hours—to registered medical specialist with credentials in cardiology.
- all medical staff trained in advanced life support.

Nursing

- suitably qualified and experienced nurse manager (however titled) in charge of unit.
- all nursing staff responsible for direct patient care are registered nurses, with enrolled nurses, student nurses and assistants in nursing in this environment under supervision of a registered nurse in supportive role.
- at least one registered nurse trained in advanced life support rostered on each separate clinical area at all times.
- all nursing staff with or working towards relevant competencies and/or education programs in post-operative cardiac surgical nursing.

Level 6

- four categories of nursing staff—intensive care, anaesthetic, perioperative and surgical cardiac ward registered nurses (for further information on nursing workforce requirements, refer to relevant Level 6 requirements in relevant modules).

Allied health

- access to allied health professionals (including perfusionist, cardiac scientist, social worker, dietician/nutritionist and occupational therapist, who may be hospital- or community-based), as required.

Other

- access to technical support staff (e.g. biomedical engineers and scientific officers), as required.

Specific risk considerations

In addition to risk management outlined in the Fundamentals of the Framework and set out in the module overview, specific risk management requirements dictate a Level 6 cardiac surgery service must:

- demonstrate processes for formal audit and review of cardiac surgical services and quality activities, including:
 - at least two targeted clinical audits annually
 - compliance with facility, network and/or any external death review processes
 - ideally, participation in Queensland Audit of Surgical Mortality, facilitated by RACS.
- comply with minimum patient throughput standards pursuant to section 12(2)(g) of Private Health Facilities Act 1999 and where patient throughput is less than the relevant standard, thereby threatening staff skill maintenance and ongoing competence, episodes of practice at higher level service may be required.

Palliative care		5
Pathology	5	
Perioperative (relevant section/s)	6	
surgical	6	

Table note: On-site means staff, services and/or resources located within the health facility or adjacent campus including third party providers.

Accessible means ability to utilise a service (either located on-site or off-site) or skills of a suitably qualified person (who may be either on-site or off-site)—without difficulty or delay—via various communication mediums including but not limited to face-to-face, telehealth, telepharmacy, and/or outreach

Section 6 Cardiac Outreach Services

Cardiac outreach services will generally be provided on a day-only / consultation basis by a higher level service where local services are unavailable. Outreach services provide a range of timely, safe and efficient services to patients who would otherwise have to travel to metropolitan or major health centres, often at significant personal cost and/or hardship. Outreach services are characterised by a multidisciplinary-care approach involving the visiting medical personnel, local doctors, midwives, and Aboriginal and Torres Strait Islander health workers. Cardiac outreach services also:

- facilitate visiting specialist and local health professional relationships, and communication about ongoing patient care
- increase and maintain the skills of regional, rural and remote health professionals in accordance with local need
- increase visiting specialist services in areas of identified need.

Cardiac outreach services must be safe and provided within the capability of the host service, which may be temporarily upgraded due to the extra personnel, equipment and support services being provided by the outreach service. When providing cardiac outreach services, the following should be considered:

- planning for outreach services must be realistic (e.g. it needs to be recognised some patient referral to a larger or higher level service will be necessary)
- must be appropriate patient assessment and referral from local healthcare providers
- services should be designed to meet a local priority and deemed necessary for the local population, as they cannot reasonably be provided by existing medical staff
- clinical support structures and processes must be in place at the local level, and these services must be staffed and resourced
- services must be planned and coordinated
- services should build on the local services and contribute to the local capacity, with sustainability being paramount
- provision of specialist cardiac services to an outreach location must take into consideration the after-care available and level of workforce skill provided on a routine basis
- procedures and treatments should only be undertaken when on-site personnel, equipment and facilities are adequate for the purpose
- consultative services provided at the outreach location by a health professional will be of a higher level than the service capability of the local service
- services are usually provided on a day-only, outpatient basis
- all registered medical practitioners providing cardiac outreach services must have appropriate credentials in the procedures or treatments offered
- on-site equipment and facilities must be adequate for the diagnostic procedure
- cardiac outreach consultation must have documented protocols and processes between the outreach service and the local facility, which should be reviewed annually

- adequate processes for the communication of consultation outcome, diagnoses and results, and ongoing patient management must be in place.

Telehealth services may be offered as an alternative. These are defined as any health delivery service where healthcare and health-related activities are provided at a distance, usually with the aid of telecommunications technology. Telemedicine is a sub-term of telehealth that relates specifically to medical practice, as opposed to other areas of healthcare, by removing physical and social distances between health professionals and their patients. The term telehealth is used throughout this document to encompass the full multidisciplinary range of services that may be provided. Telehealth is an extension of the way patients and nurses, doctors and other specialists may communicate. Telehealth has enabled:

- better access to specialist services for rural and remote communities, enabling patients to receive follow-up care and other specialist services closer to home
- provision of coordinated, timely patient care for more remote clients
- participation in education and training sessions, and case conferences, peer support sessions and meetings, without the need to leave critical clinical and administrative areas for long periods of time
- reduction in cost, time and travel burdens to patients and healthcare professionals.³
