Clinical Task Instruction

D-CM02: Heart rate measuring

Scope and objectives of clinical task

This CTI will enable the Allied Health Assistant (AHA) to:

- correctly measure and document a client’s heart rate (pulse) using the radial pulse.
- identify indications for initiating heart rate measurement.
Requisite training, knowledge, skills and experience

**Training**

- Completion of CTI D-WTS01 When to stop.
- Mandatory training requirements relevant to Queensland Health / HHS clinical roles are assumed knowledge for this CTI.
- Completion of the following Queensland Health allied health assistant training modules (or corresponding units of competency in HLT43015 Certificate IV in Allied Health Assistance) or equivalent work-based learning:
  - Physiotherapy Learner Guide: Deliver and monitor a client-specific exercise program.
    - 3.3 Monitoring requirements.
  NB: Services may elect to complete the entire module if monitoring will be performed as part of an exercise program.

**Clinical knowledge**

The following content knowledge is required by an AHA delivering this task:

- basic anatomy and physiology to the extent required to undertake this task, including terminology such as radial pulse, tachycardia and bradycardia.
- indications for initiating heart rate measuring.

The knowledge requirements will be met by the following activities:

- completing the training programs (listed above).
- reviewing the Learning resource section.
- receiving instruction from an allied health professional in the training phase.

**Skills or experience**

The following skills or experience are required by an AHA delivering this task:

- nil.

**Safety and quality**

**Client**

- The AHA will apply CTI D-WTS01 When to stop at all times.
- This CTI should be administered in conjunction with CTI D-WTS01 When to stop which includes normal values for a range of standard clinical observations and actions to implement if observations fall outside these ranges.

**Equipment, aids and appliances**

- A stop watch, or clock or watch with a second hand.
Environment

- Ensure that an appropriate level of client privacy is maintained during the task.

Performance of Clinical Task

1. Delegation instructions

- Receive delegated task from the allied health professional.
- The delegating allied health professional should clearly identify parameters for delivering the clinical task to the specific client, including any variance from the usual task procedure and expected outcomes e.g. the delegating allied health professional should indicate if an irregular heartbeat might be normal for the client. The delegating practitioner should provide guidance regarding the timing of the measurement in the broader intervention if relevant e.g. at the commencement, at 15 minute intervals, at conclusion.
- The AHA may implement this task in variance to the timing or frequency in the delegation instruction, or initiate the task if indicated by circumstances outlined in CTI D-WTS01 When to stop. The following may indicate heart rate monitoring is required:
  - Instructed by delegating allied health professional.
  - One or more of the following is reported by the client or is documented in the client’s chart:
    - light headedness, when standing from a sitting or lying position
    - dizziness e.g. swaying, balance problems, unable to focus eyes on AHA
    - weakness
    - blurred vision
    - fatigue
    - fainting
    - feeling hot or sweaty or clammy
    - recent surgery or trauma
    - low haemoglobin level (<90 g/L)
    - Also consider if client has any of the following which may affect their heart rate:
      - infection
      - dehydration
      - recent physical activity
      - recent ingestion of caffeine
      - recent cigarette smoking.

2. Preparation

- a stop watch, or clock or watch with a second hand.

3. Introduce task and seek consent

- The AHA introduces him/herself to client.
- The AHA checks three forms of client identification: full name, date of birth plus one of the following; hospital UR number, Medicare number, or address.
• The AHA describes the task to the client. For example: “I would like to measure your heart rate. Is that OK?”.
• The AHA seeks informed consent according to the Queensland Health Guide to Informed Decision-making in Health Care, 2nd edition (2017).

4. Positioning
• The client’s position during the task should be:
  – at the bedside/in bed with an over bed table positioned in front of the client, including using a clip board or seated at a table and supported in a chair.
• The AHA’s position during the task should be:
  – standing or sitting at the client’s side so that the client’s heart rate can be effectively measured.
• If using an interpreter:
  – seat the interpreter next to the AHA. This will make it easier for the client to synthesise non-verbal cues from the test administrator and the verbal cues from the interpreter.

5. Task procedure
• Explain the task to the client.
• Check the client has understood the task and provide the opportunity to ask questions.
• The task comprises the following steps:
  1. Locate the radial pulse using your index and middle fingers over the pulse. Do not use the thumb to measure a heart rate as it has its own pulse that may be felt.
  2. Count the beats for 30 seconds, then double the result to get the number of beats per minute.
  3. Record heart rate clearly and accurately as per local health service guidelines.
  4. Provide feedback to the client on their heart rate at the completion of the task.
At the conclusion of the task:
  – Take appropriate actions including CTI D-WTS01 When to stop if indicated by the heart rate reading.

6. Document
• Document the heart rate in the clinical record, consistent with relevant documentation standards and local procedures.

7. Report to the delegating health professional
• Provide comprehensive feedback to the health professional who delegated the task.
