Correction of Hammer Toes/ Curly Toes/ Mallet Toes

A. Interpreter / cultural needs

An Interpreter Service is required? ☐ Yes ☐ No
If Yes, is a qualified Interpreter present? ☐ Yes ☐ No
A Cultural Support Person is required? ☐ Yes ☐ No
If Yes, is a Cultural Support Person present? ☐ Yes ☐ No

B. Condition and treatment

The doctor has explained that you have the following condition: (Doctor to document in patient’s own words)

This condition requires the following procedure. (Doctor to document - include site and/or side where relevant to the procedure)

Left foot ☐ Yes ☐ No
Right foot ☐ Yes ☐ No

The following will be performed:
This procedure is where the joint/s of bent toe/s are removed. The tendon may also be released. Wire/s are usually put in place to keep the toes straight.

C. Risks of a correction of hammer toes/ curly toes/ mallet toes

There are risks and complications with this procedure. They include but are not limited to the following.

General risks:
• Infection can occur, requiring antibiotics and further treatment.
• Bleeding could occur and may require a return to the operating room. Bleeding is more common if you have been taking blood thinning drugs such as Warfarin, Asprin, Clopidogrel (Plavix or Iscover) or Dipyridamole (Persantin or Asasantin).
• Small areas of the lung can collapse, increasing the risk of chest infection. This may need antibiotics and physiotherapy.
• Increased risk in obese people of wound infection, chest infection, heart and lung complications, and thrombosis.
• Heart attack or stroke could occur due to the strain on the heart.
• Blood clot in the leg (DVT) causing pain and swelling. In rare cases part of the clot may break off and go to the lungs.
• Death as a result of this procedure is possible.

Specific risks:
• Complications from the tourniquet with numbness of the nerves and damage to the muscles where the tourniquet was placed.
• Skin death under the tourniquet that may require further dressings and/or surgery and skin grafting.
• High infection rate. This may require early removal of the wire, which is usually removed at 4-6 weeks.
• Return of the deformity. This may require further surgery.
• Death of the toes which may need amputation of the toes.
• Loss of blood supply to the foot requiring amputation of the leg.
• Abnormal pain response to surgery with worsening of pain and disability.
• The surgical cut may cause changes to the sensation and colour of the limb.
• In some people, healing of the wound may be abnormal and the wound can be thickened and red and the scar may be painful.

D. Significant risks and procedure options

(Doctor to document in space provided. Continue in Medical Record if necessary.)

E. Risks of not having this procedure

(Doctor to document in space provided. Continue in Medical Record if necessary.)

F. Anaesthetic

This procedure may require an anaesthetic. (Doctor to document type of anaesthetic discussed)
G. Patient consent

I acknowledge that the doctor has explained;

- my medical condition and the proposed procedure, including additional treatment if the doctor finds something unexpected. I understand the risks, including the risks that are specific to me.
- the anaesthetic required for this procedure. I understand the risks, including the risks that are specific to me.
- other relevant procedure/treatment options and their associated risks.
- my prognosis and the risks of not having the procedure.
- that no guarantee has been made that the procedure will improve my condition even though it has been carried out with due professional care.
- the procedure may include a blood transfusion.
- tissues and blood may be removed and could be used for diagnosis or management of my condition, stored and disposed of sensitively by the hospital.
- if immediate life-threatening events happen during the procedure, they will be treated based on my discussions with the doctor or my Acute Resuscitation Plan.
- a doctor other than the Consultant may conduct the procedure. I understand this could be a doctor undergoing further training.

I have been given the following Patient Information Sheet/s:

☐ About Your Anaesthetic OR
☐ Epidural & Spinal Anaesthesia
☐ Correction of Hammer Toes/ Curly Toes/ Mallet Toes

I was able to ask questions and raise concerns with the doctor about my condition, the proposed procedure and its risks, and my treatment options. My questions and concerns have been discussed and answered to my satisfaction.

I understand I have the right to change my mind at any time, including after I have signed this form but, preferably following a discussion with my doctor.

I understand that image/s or video footage may be recorded as part of and during my procedure and that these image/s or video/s will assist the doctor to provide appropriate treatment.

On the basis of the above statements,
Correlation of Hammer Toes/ Curly Toes/ Mallet Toes

1. What do I need to know about this procedure?
This procedure is where the joint/s of bent toe/s are removed. The tendon may also be released. Wire/s are usually put in place to keep the toes straight.

2. My anaesthetic
This procedure will require an anaesthetic.
See About Your Anaesthetic OR Epidural and Spinal Anaesthetic for information about the anaesthetic and the risks involved. If you have any concerns, discuss these with your doctor.

If you have not been given an information sheet, please ask for one.

3. What are the risks of this specific procedure?
There are risks and complications with this procedure. They include but are not limited to the following.

**General risks:**
- Infection can occur, requiring antibiotics and further treatment.
- Bleeding could occur and may require a return to the operating room. Bleeding is more common if you have been taking blood thinning drugs such as Warfarin, Aspirin, Clopidogrel (Plavix or Iscover) or Dipyridamole (Persantin or Asasatin).
- Small areas of the lung can collapse, increasing the risk of chest infection. This may need antibiotics and physiotherapy.
- Increased risk in obese people of wound infection, chest infection, heart and lung complications, and thrombosis.
- Heart attack or stroke could occur due to the strain on the heart.
- Blood clot in the leg (DVT) causing pain and swelling. In rare cases part of the clot may break off and go to the lungs.
- Death as a result of this procedure is possible.

**Specific risks:**
- Complications from the tourniquet with numbness of the nerves and damage to the muscles where the tourniquet was placed.
- Skin death under the tourniquet that may require further dressings and/or surgery and skin grafting.
- High infection rate. This may require early removal of the wire, which is usually removed at 4-6 weeks.
- Return of the deformity. This may require further surgery.
- Death of the toes which may need amputation of the toes.
- Loss of blood supply to the foot requiring amputation of the leg.
- Abnormal pain response to surgery with worsening of pain and disability.

**Notes to talk to my doctor about:**
- The surgical cut may cause changes to the sensation and colour of the limb.
- In some people, healing of the wound may be abnormal and the wound can be thickened and red and the scar may be painful.
