Mastectomy

A. Interpreter / cultural needs
An Interpreter Service is required? [ ] Yes [ ] No
If Yes, is a qualified Interpreter present? [ ] Yes [ ] No
A Cultural Support Person is required? [ ] Yes [ ] No
If Yes, is a Cultural Support Person present? [ ] Yes [ ] No

B. Condition and treatment
The doctor has explained that you have the following condition: (Doctor to document in patient’s own words)

This condition requires the following procedure. (Doctor to document - include site and/or side where relevant to the procedure)

The following will be performed:
The removal of the whole breast, the nipple and the lining over the chest muscles deep to the tumour.
All the removed tissue will be sent for pathology tests to establish if all of the tumour has been removed.
Some or all of the lymph nodes in the armpit on the same side of the tumour will also be removed and sent for pathology tests to establish if any lymph nodes are affected.
Breast reconstruction may also be performed immediately after removing the breast
If yes, the breast will be reconstructed using:
- tissue from other parts of the body [ ] Yes [ ] No
- a prosthesis. [ ] Yes [ ] No

C. Risks of a mastectomy
There are risks and complications with this procedure. They include but are not limited to the following.

General risks:
- Infection can occur, requiring antibiotics and further treatment.
- Bleeding could occur and may require a return to the operating room. Bleeding is more common if you have been taking blood thinning drugs such as Warfarin, Aspirin, Clopidogrel (Plavix or Iscover) or Dipyridamole (Persantin or Asasantin).
- Small areas of the lung can collapse, increasing the risk of chest infection. This may need antibiotics and physiotherapy.
- Increased risk in obese people of wound infection, chest infection, heart and lung complications, and thrombosis.
- Heart attack or stroke could occur due to the strain on the heart.
- Blood clot in the leg (DVT) causing pain and swelling. In rare cases part of the clot may break off and go to the lungs.
- Death as a result of this procedure is possible.

Specific risks:
- The operation site under the arm continues to ooze fluid. This may need to be drained with a needle and syringe.
- The edges of the wound may lose blood supply and change colour. Further surgery may be needed to cut out the affected areas along the wound.
- Weakness and numbness of the arms and chest may happen due to certain nerves being cut during the operation.
- Difficulty with arm movement due to shoulder stiffness after the operation.
- The layers of the wound may not heal adequately and the wound may burst open.
- The wound may not heal normally. The scar can be thickened and red and may be painful.
- Swelling of the arm (lymphoedema) on the side of the operation.
- Recurrence of tumour in or around the scar which will need further treatment to remove or to destroy the tumours.
- Chronic pain after mastectomy in the area of the surgery. It is usually managed with drugs prescribed by pain specialist.
- Feelings of anxiety and depression due to the disease and possible recurrence.
- Feelings of anxiety and depression due to losing a breast.
- Loss of sexuality due to distress at the change in body image or depression due to the disease.
- Increased risk in smokers of wound and chest infections, heart and lung complications and thrombosis.

D. Significant risks and procedure options
(Doctor to document in space provided. Continue in Medical Record if necessary.)

E. Risks of not having this procedure
(Doctor to document in space provided. Continue in Medical Record if necessary.)

F. Anaesthetic
This procedure may require an anaesthetic. (Doctor to document type of anaesthetic discussed)
Mastectomy

G. Patient consent
I acknowledge that the doctor has explained;
- my medical condition and the proposed procedure, including additional treatment if the doctor finds something unexpected. I understand the risks, including the risks that are specific to me.
- the anaesthetic required for this procedure. I understand the risks, including the risks that are specific to me.
- other relevant procedure/treatment options and their associated risks.
- my prognosis and the risks of not having the procedure.
- that no guarantee has been made that the procedure will improve my condition even though it has been carried out with due professional care.
- the procedure may include a blood transfusion.
- tissues and blood may be removed and could be used for diagnosis or management of my condition, stored and disposed of sensitively by the hospital.
- if immediate life-threatening events happen during the procedure, they will be treated based on my discussions with the doctor or my Acute Resuscitation Plan.
- a doctor other than the consultant/specialist may conduct/assist with the clinically appropriate procedure/treatment/investigation/examination. I understand this could be a doctor undergoing further training. I understand that all surgical trainees are supervised according to relevant professional guidelines.

I was able to ask questions and raise concerns with the doctor about my condition, the proposed procedure and its risks, and my treatment options. My questions and concerns have been discussed and answered to my satisfaction.

I understand I have the right to change my mind at any time, including after I have signed this form but, preferably following a discussion with my doctor.

I understand that image/s or video footage may be recorded as part of and during my procedure and that these image/s or video/s will assist the doctor to provide appropriate treatment.

Student examination/procedure for educational purposes
For the purpose of undertaking professional training, a student/s may observe the medical examination/s or procedure/s and may also, subject to patient consent, perform an examination/s or assist in performing the procedure/s on a patient while the patient is under anaesthetic. This is for education purposes only. A student/s who undertakes an examination/s or assists in performing the procedure/s will be under the supervision of the treating doctor, in accordance with the relevant professional guidelines.

For the purposes of education I consent to a student/s undergoing training to:
- observe examination/s or procedure/s □ Yes □ No
- assist and/or perform examination/s □ Yes □ No or procedure/s

Student - this may include medical, nursing, midwifery, allied health or ambulance students.

I have been given the following Patient Information Sheet/s:
[ ] About Your Anaesthetic
[ ] Mastectomy
[ ] Blood & Blood Products Transfusion

On the basis of the above statements,
I request to have the procedure
Name of Patient:..........................................................
Signature:..........................................................
Date:..........................................................

Patients who lack capacity to provide consent
Consent must be obtained from a substitute decision maker/s in the order below.

Does the patient have an Advance Health Directive (AHD)?
[ ] Yes □ Location of the original or certified copy of the AHD:
[ ] No □ Name of Substitute Decision Maker/s:
Signature:..........................................................
Relationship to patient:..........................................
Date:................. PH No:..........................

Source of decision making authority (tick one):
[ ] Tribunal-appointed Guardian
[ ] Attorney/s for health matters under Enduring Power of Attorney or AHD
[ ] Statutory Health Attorney
[ ] If none of these, the Adult Guardian has provided consent Ph 1300 QLD OAG (753 624)

H. Doctor/delegate statement
I have explained to the patient all the above points under the Patient Consent section (G) and I am of the opinion that the patient/substitute decision-maker has understood the information.

Name of Doctor/delegate:..........................................
Designation:..........................................................
Signature:..........................................................
Date:..........................................................

I. Interpreter's statement
I have given a sight translation in

(state the patient’s language here) of the consent form and assisted in the provision of any verbal and written information given to the patient/parent or guardian/substitute decision-maker by the doctor.

Name of Interpreter:..........................................
Signature:..........................................................
Date:..........................................................
PLEASE READ THIS SHEET BEFORE YOU CONSENT TO YOUR SURGERY.

This information sheet provides general information to a person having breast cancer surgery. It does not provide advice to the individual. It is important that you talk about this with your Doctor who understands your level of fitness and your medical condition.

1. The condition
The breast is a glandular tissue (can secrete substances). Around the breast are lymph nodes. These are part of the lymphatic system.
Lymphatic vessels run from the limbs towards the heart, usually beside veins. They carry fluid called lymph, which is a collection of dead cells, waste material and leakage from ordinary blood vessels.
At various points along a lymphatic vessel lie lymph nodes. These are usually small - 5mm or less in most places. Lymph nodes are scattered at various points around the body, but the most important ones for breast disease are in the armpit.
Cancer cells travel along lymphatic vessels and collect in lymph nodes. In breast cancer, the lymph nodes of the armpit are usually the first site of spread.

2. What is breast surgery?
It is important to understand that breast surgery for cancer is not cosmetic surgery. The appearance of the breast after surgery will be different from that before surgery.
The survival rates for women who have mastectomy (all of the breast removed) are the same as for women who have breast-conserving surgery accompanied by radiotherapy, and each form of treatment has its advantages.

Wide local excision
The removal of a lump in the breast and the tissue around it. The lymph nodes under the arm on the same side as the tumour may also be removed and tested for cancer. If the lump cannot be felt, a marking wire may need to be placed before surgery. This is usually done in the X-Ray department using ultrasound or mammogram.

Partial or segmental mastectomy
The removal of the tumour as well as some of the breast tissue around it and the lining over the chest muscles below. Usually some of the lymph nodes under the arm are taken out and tested for possible spread of cancer.

Total or simple mastectomy
The removal of the whole breast. Sometimes lymph nodes under the arm are also taken out and tested for possible spread of cancer.

Modified radical mastectomy
The removal of the breast, many of the lymph nodes under the arm, the lining over the chest muscles, and sometimes part of the chest wall muscles.

Radical mastectomy
The removal of the breast, chest muscles, and all of the lymph nodes under the arm. It is used only when the tumour has spread to the chest muscles and the wound may burst open.

Reconstruction
Breast reconstruction involves the use of prostheses (artificial breast tissue) or tissue from other parts of the body. The type of prosthesis can be either silicone filled but are usually saline filled implants. Soft tissue may be taken from the other breast, the back or abdomen depending on body shape and size.

3. What are the benefits of having this procedure?
The aim of the surgery is to get rid of the tumour so it cannot spread. It is generally considered that surgery is effective for early breast cancer. For cancer that has spread outside of the breast and lymph nodes, the benefits of surgery are unclear. You need to discuss your options very carefully with your doctor so that you can make the best decision for your situation.

4. What if I don’t have this procedure?
If you choose not to have surgery, you may be shortening your life expectancy. The tumour may also grow outside the breast and spread to other parts of the body. This can cause significant pain and discomfort.
5. Comparison between breast conserving treatment and mastectomy

<table>
<thead>
<tr>
<th></th>
<th>Breast conserving treatment that includes radiation therapy</th>
<th>Mastectomy</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Effectiveness</strong></td>
<td>Breast conserving treatment with radiation therapy is as effective as mastectomy.</td>
<td>Mastectomy is as effective as breast conserving treatment that includes radiation therapy.</td>
</tr>
<tr>
<td><strong>Tumour size and position</strong></td>
<td>If the tumour is small then your surgeon will probably recommend that you choose between breast conserving treatment and mastectomy.</td>
<td>If the tumour is large or involves the nipple or there is more than one tumour your surgeon will probably recommend mastectomy.</td>
</tr>
<tr>
<td><strong>Radiation therapy</strong></td>
<td>Radiation therapy is necessary each weekday for about six weeks.</td>
<td>Usually no radiation therapy is necessary.</td>
</tr>
<tr>
<td><strong>Changes to your body appearance</strong></td>
<td>A small amount of your breast will be removed. Partial prostheses are available.</td>
<td>Your whole breast will be removed. Prostheses and/or reconstruction are available.</td>
</tr>
<tr>
<td><strong>Fear of the cancer returning</strong></td>
<td>Some women feel concerned about getting cancer in the remaining part of the breast and in other parts of their body. Breast conserving treatment that includes radiation therapy is as effective as mastectomy in treating early breast cancer.</td>
<td>It is very unlikely that the cancer will come back in the breast area after a mastectomy. It is no ‘safer’ to have a mastectomy than breast conserving treatment.</td>
</tr>
</tbody>
</table>

6. Specific risks of breast cancer surgery

<table>
<thead>
<tr>
<th>The risk</th>
<th>What happens</th>
<th>What can be done about it</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Infection</strong></td>
<td>Infection in the operation site causing pain, swelling, redness and discharge in 1 in 25 to 1 in 58 people. The wound may break down.</td>
<td>Treatment may be wound dressings, drainage and antibiotics.</td>
</tr>
<tr>
<td><strong>Collection of fluid under the skin</strong></td>
<td>The operation site under the arm continues to ooze fluid, which collects beneath the cut.</td>
<td>The collection may need to be drained with a needle and syringe. This may need to be repeated several times until the oozing stops.</td>
</tr>
<tr>
<td><strong>Poor healing</strong></td>
<td>The edges of the wound may lose blood supply and change colour.</td>
<td>Further surgery may be needed to cut out the affected areas along the wound.</td>
</tr>
<tr>
<td><strong>Numbness and weakness to arms and chest</strong></td>
<td>Weakness and numbness of the arms and chest may happen due to certain nerves being cut during the operation.</td>
<td>This may be temporary or permanent.</td>
</tr>
<tr>
<td><strong>Shoulder stiffness</strong></td>
<td>Difficulty with arm movement after the operation.</td>
<td>This is usually temporary when treated with physiotherapy and/ or exercises.</td>
</tr>
<tr>
<td><strong>Poor wound healing</strong></td>
<td>The layers of the wound may not heal well and the wound may burst open.</td>
<td>This may need long term wound care with dressings and antibiotics.</td>
</tr>
<tr>
<td><strong>The wound may not heal normally</strong></td>
<td>The scar can be thickened and red and may be painful.</td>
<td>This is permanent and can be disfiguring.</td>
</tr>
<tr>
<td><strong>Swelling of the arm (lymphodoema)</strong></td>
<td>The arm on the side of the operation may swell in 1 in 4 women. This may be caused by removal of the lymph nodes in the armpit. The risks are increased by damage to the arm, taking of blood specimens, infection and weight gain.</td>
<td>The average time between treatment and development of lymphodoema is 20 months but can occur years later. It can be treated with a special type of garment, which squeezes the arm to reduce the fluid build-up. Regular massage is also used.</td>
</tr>
<tr>
<td><strong>The cancer re-grows</strong></td>
<td>Recurrence of tumour in or around the scar can occur.</td>
<td>Further treatment to remove or to destroy the tumours. This may be surgery, chemotherapy or radiotherapy or a combination of all three.</td>
</tr>
<tr>
<td><strong>Pain after mastectomy</strong></td>
<td>After mastectomy, there may be chronic pain in the area of the surgery. This may happen in 2 out of 3 women in the 30-49 year age group decreasing to 1 in 4 women over the age of 70 years.</td>
<td>The level of pain varies between people. It is usually managed with drugs prescribed by pain specialist</td>
</tr>
<tr>
<td><strong>Anxiety and/ or depression after lumpectomy</strong></td>
<td>Feelings of anxiety and depression due to the disease and possible recurrence for every 2 out of 5 women.</td>
<td>Professional counselling both before and after the surgery.</td>
</tr>
</tbody>
</table>

7. **What are the general risks of the procedures?**

**General risks:**
- Infection can occur, requiring antibiotics and further treatment.
- Bleeding could occur and may require a return to the operating room. Bleeding is more common if you have been taking blood thinning drugs such as Warfarin, Aspirin, Clopidogrel (Plavix or Iscover) or Dipyridamole (Persantin or Asasantin).
- Small areas of the lung can collapse, increasing the risk of chest infection. This may need antibiotics and physiotherapy.
- Increased risk in obese people of wound infection, chest infection, heart and lung complications, and thrombosis.
- Heart attack or stroke could occur due to the strain on the heart.
- Blood clot in the leg (DVT) causing pain and swelling. In rare cases part of the clot may break off and go to the lungs.
- Death as a result of this procedure is possible.

8. **Are there any alternative treatments?**

As with most solid tumours, removing the tumour surgically is considered the first part of treatment in almost all cases.

9. **Are there any additional treatments?**

Also known as adjuvant therapy, they are used in some women in addition to surgery. The treatment may be local (radiation) or systemic (whole body e.g. chemotherapy, hormone therapy). The aim is to treat undetectable tumours before surgery. The treatment of breast cancer depends very much on the type of tumour, the size and stage of the tumour and your age and health. You need to carefully discuss with your doctor, treatments that are best for you.

**The following treatments are all used either separately or together in the treatment of breast cancer.**

- **Radiotherapy**
  Radiotherapy after breast conserving surgery reduces the risk of the cancer coming back in the same breast by 1 to 2% per year.
  Radiation is used to damage or kill cancer cells. Most women have radiotherapy to the breast find their health is not greatly affected by it. Tiredness is a most common problem.

- **Chemotherapy and hormone therapy**
  Chemotherapy is most effective if more than one drug is used and is more effective in women under the age of 50 years. The main side effects are nausea, vomiting, hair loss, marked tiredness and mood changes. They do not last for long periods and most can be controlled with good medical care. There are other side effects from chemotherapy, which you need to discuss with your doctor.

- **High dose chemotherapy**
  The theory is that high doses will kill off more cancer cells than normal doses of chemotherapy. However, it is experimental, very toxic and can be fatal.

- **Tamoxifen**
  Tamoxifen is a drug that works by blocking the effects of oestrogen on cells. It is thought that oestrogen may be causing the cancer to grow. In most cases, the cancer stops growing although it does not kill cancer cells.

- **Ovarian treatment**
  The purpose of ovarian treatment is to reduce the amount of oestrogen produced by the ovary. It is only useful in women who have not yet reached menopause. Ovarian treatment is performed using either implants under the skin, surgical removal of the ovaries or radiation to the ovaries.

- **Combined treatments**
  Overall, the evidence of benefits from using one or more treatments at the same time does not suggest that there is any large benefit to be gained, but there may be some benefit if the cancer cells are hormone sensitive.
10. Who will be performing the procedure?

A doctor other than the consultant/specialist may conduct/assist with the clinically appropriate procedure/treatment/investigation/examination. I understand this could be a doctor undergoing further training, and that all trainees are supervised according to relevant professional guidelines.

If you have any concerns about which doctor/clinician will be performing the procedure, please discuss with the doctor/clinician.

For the purpose of undertaking professional training in this teaching hospital, a student/s may observe the medical examination/s or procedure/s. Subject to your consent, a student/s may perform an examination/s or assist in performing the procedure/s while you are under anaesthetic. This is for education purposes only. A student/s who undertakes an examination/s or assists in performing the procedure/s will be under the supervision of the treating doctor, in accordance with relevant professional guidelines.

If you choose not to consent, it will not adversely affect your access, outcome or rights to medical treatment in any way. You are under no obligation to consent to an examination/s or a procedure/s being undertaken by a student/s for education purposes.

11. Recovering from your procedure?

After the operation, you will go back to the ward when you have recovered from the anaesthetic, until you are well enough to go home, about 2 days after wide local excision and 2-4 days after mastectomy. If you have any side effects from the anaesthetic, such as headache, nausea, vomiting, tell the nurse looking after you, who will be able to give you some medication to help.

Pain

You can expect to have pain in the operation site. There are a number of ways in managing your pain.

You may have:
- a drip with painkillers into the vein
- a drip with painkillers that you can give yourself when you feel pain
- injections.

It is important that you tell the nursing staff if you are having pain. Your pain should wear off within 7-10 days. If it does not, you must tell your doctor.

Diet

You will have a drip in your arm when you come back from surgery. This will be removed when you are able to take food and fluids by mouth and you are no longer feeling sick. To begin with, you can have small sips of water then slowly take more until you are eating normally.

Wounds

You may have clips, stitches and/or stitches that are dissolvable or a combination of both. Your wound may have a dressing and you will also have a wound drain, which is removed after 3-4 days or as soon as the drainage has stopped. Continue to keep your wound clean and protected until healed and no seepage is present.

Your lungs and blood supply

It is very important after surgery that you start moving as soon as possible. This is to prevent blood clots forming in your legs and possibly traveling to your lungs. This can be fatal. To help prevent against clots forming in your legs, you may have support stockings (TEDS) on before you go to surgery and these will stay on until you are walking on your own. You may also be put on drugs to thin your blood.

Also, you need to do your deep breathing exercises, ten deep breaths every hour, to get the secretions in your lungs moving and help prevent a chest infection. Avoid smoking after surgery as this increases your risk of chest infection which causes coughing - a painful experience after surgery.

Exercise

You will feel tired for some time after surgery. (You need to take things easy and gradually return to normal duties, as you feel able to.) You should not drive during the first 1-2 weeks and until you have a reasonable range of movement in your shoulder. You will be taught how to do arm exercises. It is important that you follow these to help you return to a normal range of shoulder movements.

If you have had surgery and/or radiotherapy to the armpit

The arm on the same side of the surgery and/or radiotherapy needs care to help in the prevention of lymphoedema (swelling in the armpit). You should avoid the following with that arm:
- Blood taking or blood pressure measurement
- Carrying anything heavy
- Tight clothing or jewelry
- Cuts, burns and insect bites

And use:
- Skin cream to keep the arm moist
- Cooling devices during the hot summer
- Gloves to wash up
- Gloves and long sleeved shirt when gardening.

Sexuality and self-esteem

Many women may have problems with their sexuality and self-esteem after breast cancer surgery. Your doctor may refer you for psychological counselling before and after your surgery so that you and your partner can work through these problems.

12. Tell your doctor if you have:

- fever and chills.
- pain that is not relieved by prescribed pain killers.
- swelling, tenderness, redness at or around the cut.
- swelling of the arm.
- a cut or infection to the arm on the same side as your treatment.
